

START HERE

Flutter Day 1 - Please work down this page before we begin. Do not wait for the instructor.

Your first Flutter build downloads about **4 GB** and takes several minutes. The sooner you start it, the smoother your day. Everything this morning runs in a web browser, so **nothing here can hold you back** - if you get stuck, raise your hand and carry on to the last section.

Step 1 - Which lane are you in?

Open **PowerShell**: press the Windows key, type `power shell`, press Enter.

Type this and press Enter:

```
flutter --version
```

Then this:

```
flutter doctor
```

Look at what came back and pick your lane below.

What you saw	Your lane
A version number, and doctor shows a tick next to Android toolchain	Lane A
A version number, but Android toolchain has an X or is missing	Lane B
<code>flutter</code> is not recognised	Lane C

LANE A - you are ready. Start the build now.

```
cd $HOME
```

```
flutter create --org za.co.moint quote_app
```

```
cd quote_app
```

```
flutter build apk --debug
```

Leave that running. It will take five to ten minutes. Go to **Everyone** at the bottom of the page.

LANE B - Flutter is installed, Android is not.

Start this download first, then come back:

Open a browser and go to <https://developer.android.com/studio> and start the Android Studio download.

While it downloads, go to **Everyone** at the bottom of this page.

When the download finishes, install it, run the setup wizard and choose **Standard**. Then tell the instructor you have reached this point.

LANE C - nothing installed yet.

Start **both** of these downloads now, in a browser. Do not wait for one to finish before starting the other.

1. <https://docs.flutter.dev/get-started/install/windows> - download the Flutter SDK zip
2. <https://developer.android.com/studio> - download Android Studio

While they download, go to **Everyone** at the bottom of this page.

When the Flutter zip has finished downloading, extract it to `C:\src\flutter` so that you end up with a folder called `C:\src\flutter\bin`.

Then open PowerShell and run this:

```
$u = [Environment]::GetEnvironmentVariable("Path", "User")
```

```
[Environment]::SetEnvironmentVariable("Path", "$u;C:\src\flutter\bin", "User")
```

Close PowerShell. Open a **new** PowerShell. Then:

```
flutter --version
```

EVERYONE - do this while things download

Open a browser tab at:

<https://dartpad.dev>

That is where this morning's exercises run. It needs no installation and works on any machine.

Leave that tab open. We start at **09:00**.

Before you sit back

Fill this in and leave it on the table. It tells the instructor where the room is without asking twenty people one at a time.

Name: _____

Lane (circle one): A · B · C

Your main language day to day (circle): C# · TypeScript / JavaScript · Java · Other: _____

Front end you use (circle): React · Angular · Blazor · None / Other: _____

Have you written any Flutter before? (circle): Never · Tried a tutorial · Built something real

If something goes wrong

What you see	What to do
<code>flutter</code> is not recognised, but you installed it	Close PowerShell, open a new one, try again
<code>cmdline-tools component is missing</code>	Leave it. The instructor covers this in the first hour
<code>Android license status unknown</code>	Leave it. It is a known Flutter bug, not your machine
Anything else	Raise your hand, then carry on to dartpad.dev

Nothing on this page can stop you taking part this morning. All of today's first exercises run in the browser.
